Individual FH 295 carries two mutant LDL receptor alleles. The allele below was inherited from the far and includes a duplication of exons 2 through 8 that was presumably created by unequal chromosomal crossover involving Alu repeats in introns 1 and 8. The exact site of recombination cannot be determined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 (bases 1 to 90)
Lehrman, M.A., Goldstein, J.L., Russell, D.W. and Brown, M.S.
Duplication of seven exons in LDL receptor gene caused by Alu-
recombination in a subject with familial hypercholesterolemia
Cell 48 (5), 827-835 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          M15365.1 GI:187107

Consider the nucleotide sequence for the PCR primer used in the confidence of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the csequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Example 1, Page 45, 17/pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Primer PDJ3 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

CC A method for detecting the presence of neural thread protein (NTP)
CC A method for detecting the presence of neural thread protein (NTP)
CC subject comprises (a) contacting a sample from a human subject that
CC subject comprises (b) contacting a sample from a human subject that
CC capable of containing the NTP with at least one molecule
CC capable of binding to the protein; and (b) detecting any of the
CC molecule bound to the protein. The binding molecule is selected
CC from an antibody free of natural impurities, a monoclonal antibody
CC or a binding fragment of either of these. The method may be used for
CC diagnosing the presence of Alzheimer's disease, neuroectodermal
CC tumours and a malignant astrocytoma in a human. Expression of NTP
CC (See T2739-44)
CC (See T2739-44)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of neural thread proteins - to detect sporadic and familial Alzheimer's disease, neuroectodermal tumours, malignant astrocytomas and glioblastomas (Eng).
Disclosure; Page 48; 158pp; English.
077888-077890 are ADIO-7 neural thread protein (NTP) antisense oligonucleotides, that can be used to down regulate or inhibit the expression of the NTP gene. These oligonucleotides could be used in the treatment of the folowing conditions Alzheimer's disease, neuroectodermal tumours, malignant astrocytomas and glioblastomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-NOV-1996 (first entry)

CC T98497-T98520 represent primers used in the method of the invention. The CC method of the invention is for preparing DNA complementary to the 5'-end CC finer to the RNA molecule and synthesissing a first DNA strand CC complementary to at least a portion of the RNA molecule, and contacting the RNA molecule with a template switching oligonucleotides (TSO) (such as T98426) having a pre-selected nucleotide sequence at its 5'-end and at least 1 riboguanine residue at its 3'-end, where the TSO binds the 5'-end cf the RNA molecule and serves as a template for the extension of the CC 3'-end of the first DNA strand. The method can be used for the synthesis and cloning of full length cDNA, or fragments, that correspond to the CC construct cDNA libraries from nanogram quantities of total or poly A+ CC RNA. The TSO allows for negative selection against cDNA that are not complementary to the 5'-end of the template RNA, while allowing full CC length cDNA to be readily selected.

CC T98497-T98520 represent primers used in the method of the invention. The CC method of the invention is for preparing DNA complementary to the 5'-end CC of an RNA molecule. The method comprises annealing a cDNA synthesis CC complementary to at least a portion of the RNA molecule, and contacting CC complementary to at least a portion of the RNA molecule, and contacting CC as T98426) having a pre-selected nucleotide sequence at its 5'-end and at CC least 1 riboguanine residue at its 3'-end, where the TSO binds the 5'-end CC is the RNA molecule and serves as a template for the extension of the CC 3'-end of the first DNA strand. The method can be used for the synthesis CC complete sequence of the 5'-end of the many molecule. It can be used to the CC construct cDNA libraries from nanogram quantities of total or poly A+ CC RNA. The TSO allows for negative selection against cDNA that are not CC complementary to the 5'-end of the template RNA, while allowing full CC length cDNA to be readily selected.

PT Quantifying genomic DNA by amplification of repetitive sequences -
prin presence of internal standard, then comparing amts of amplified
prince DNA and standard, partic. for quality control of recombinant
prince DNA and standard, partic.
prince DNA in a sample set.

Claim 13; Page 14; 41pp; German.

Primers T12508-9 are used to amplify a 146 bp fragment of an Alu repeat
csequence in a novel method of quantitating genomic DNA in a sample. The
novel method features the addition of a known amount of an internal
standard nucleic acid which is different from the test nucleic acid in
cat least one detectable feature. The template for these primers is the
plasmid pAlu-wt which comprises plasmid pCRII contg. nucleotides 148-294
of the Alu repeat sequence given in Nucleic Acid Res., 18 (1990) 6793.
The method is esp. useful for the detection of contaminating DNA in the
manufacture of therapeutic prods.

DNA construct for treating human carcinoma - includes a cancer-therapeutic gene under the control of a promoter and a gp. of enhancer sequences

Claim 1; Fig. 6; 54pp; English.

This enhancer element is part of a DNA construct used for treating human carcinoma which contains a cancer therapeutic protein under the control of a promoter and 3 enhancer sequences in a specific 5'-3' order. This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene.

Claim 1; Fig.6; 549p; English.
This enhancer element is part of a DNA construct used for treating
thuman carcinoma which contains a cancer therapeutic protein under
the control of a promoter and 3 enhancer sequences in a specific 5'-3'
order. This enhancer element is derived from the flanking region of
the human epithelial cell cytokeratin-8 gene.

Comparison of First strand was example; page 7; 75pp; English.

Comparison of First Strand was amplified by PCR using converted into dsDNA and this cDNA was amplified by PCR using converted into dsDNA and this cDNA was amplified by PCR using converted the dsDNA and this cDNA was amplified by PCR using converted the dsDNA and this cDNA was amplified by PCR using converted the dsDNA was amplified by 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

CC The present sequence encodes a portion of E. novel human secreted protein CC deposited under accession number ATCC 98026. The secreted protein can be used to determine biological activity, to raise antibodies, as tissue that modulate their interactions and as nutritional supplements. It may called the provided in the specification. Typical of these are induction of other cytokines; immunostimulating/immunosuppressant cartivities (e.g. for treating human immunodeficiency virus infection, carter, autoimmune diseases and allergy); regulation of haematopoiesis (e.g. for treating anaemia or as adjunct to chemotherapy); stimulation of prowth of bone, cartilage, tendons, ligaments and/or nerves (e.g. for control of fertility); chemotactic and chemokinetic activities (e.g. for treating infections, tumours); haemostiatic or thrombolytic (e.g. for treating infections, tumours); haemostiatic or thrombolytic activity (e.g. for treating infections; tumours); haemostiatic or thrombolytic canti-inflammatory activity (e.g. for treating septic shock, Crohn's cartivity (e.g. for treating septic shock, Crohn's cativity (e.g. for treating septic shock, Crohn's cartivity (e.g. for treating sportasis or other hyperproliferative disease; for regulation of metabolism, behaviour, and cardid in gene therapy procedures.

                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a method for detecting the presence of telomerase cc activity. The method comprises of (a) providing a test nucleic acid, ce 9. the nucleic acid sequence shown in V54635, that will be elongated by telomerase; (b) incubating the test nucleic acid with the sample containing a telomerase; and (c) detecting the elongated concleic acid, e.g. see V54639, using a detector sequence such as the cc present one or the sequence shown in V54637. The test nucleic acid, ci immobilised on a solid support, comprises of a hairpin and/or a telomeric repeat sequence, prior to elongation by telomerase. Detection cc of telomeric repeat sequence, prior to elongation by telomerase. Cc carcinogenicity and senescence in cells. The assay is also claimed to be useful for determining the effects of compounds on telomerase activity is claimed to be useful for determining the effects of compounds on telomerase activity. The identified telomerase inhibitors might then be useful in cc activity. The identified telomerase inhibitors might then be useful in cc sequence 53 BP; 7 A; 12 C; 1 G; 33 T;

/note="Organ: placenta; Vector: pAMP10; cDNA was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT). From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA selection using chromosome 7 genomic DNA (cosmids). The resulting direct-selected cDNA was cloned into a plasmid vector using a non-directional uracil DNA glycosylase (UDG)-mediated cloning strategy."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             March 31, 2000, 10:14:26; Search time 599.64 Seconds (without alignments) 12517.532 Million cell updates/sec

                                                  Pri detecting nucleic acids, telomerase activity, oncogene mutations, or pri cancer specific sequences, for diagnosis of disease
Example 11; Page 318; 478pp; English.

CC A process has been developed for determining the sequence of a target nucleic acid. The process comprises: (1) generating at least two concerns the process comprises: (1) generating at least two concerns the process comprises: (1) generating at least two concerns the process in v39483 to v39592 are greated to detect genetic diseases.

CC of the above process. The process is used to detect genetic diseases comprises: (2) or the above process. The process is used to detect genetic diseases. CC of the above process. The process is used to detect genetic diseases. CC of the above process. The process is used to detect genetic diseases. CC of predisposition); infections and cancers; also for establishing constity and heredity. Particular applications are diagnosis of neuroblastoma, detecting telomerase, determining family relationships constity and in genetic fingerprinting. Compared with known methods using MS, this process requires fewer specific reagents cand is better suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of construction and example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                          problection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols as primers placelosure; Column 11-12; 186pp; English.

Disclosure; Column 11-12; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences for invention relates to the isolation of polymorphic repeat sequences. The invention relates to the isolation of polymorphic repeat sequences can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, the invention of the invention analysis of genetic disease, containing the repeat sequences were isolated by hybridisation of containing the repeat sequences were isolated by hybridisation of probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers 765798-76647. Those clones where the repeat sequence has been determined are shown in 765704-797. This repeat sequence is from the marker clone Mdf67 which contains the repeat sequence having the formula: (TO)12(AC)18.

PT Detection of polymorphic genetic markers of the form PT Detection of polymorphic genetic acid mols. as primers PT (20 da)n(dG-dT)n - using novel nucleic acid mols. as primers PT (20 da)n(dG-dT)n which can be used as genetic CC The invention relates to the isolation of polymorphic repeat sequences CC markers. Primers based on these sequences can be used to detect these CC markers. Primers based on the sequences can be used to detect these CC markers. Primers based on the region of the sequences can be used to detect these CC commercial animal or plant breeding or pedigree analysis of genetic disease, CC commercial animal or plant breeding or pedigree analysis.

CC The repeats, when analysed, fall into 4 categories:

CC 1) perfect repeats which are alternating tandem CA repeats with no CC interruptions and without adjacent repeats of another sequence;

CC 2) imperfect repeats which are defined as 2 or more runs of uninterrupted CC 2) imperfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases;

CC 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least CC 3 uninterrupted dinucleotide or longer repeats of a sequence other than CC 4) imperfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect

                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PT Detection of polymorphic genetic markers of the form
PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
PS Disclosure; Column 13-14; 186pp; English.
CC The invention relates to the isolation of polymorphic repeat sequences
CC thaving the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC comman genetic analysis such as linkage analysis of genetic disease,
CC commercial animal or plant breeding or pedigree analysis. Clones
CC containing the repeat sequences were isolated by hybridisation of
CC chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT)
CC grobe. Over 100 repeat blocks were isolated by hybridisation of
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence is from the marker clone Mdfill which contains the repeat
CC sequence having the formula: (ATTT)llAT.
